Applying One Hot Encoding

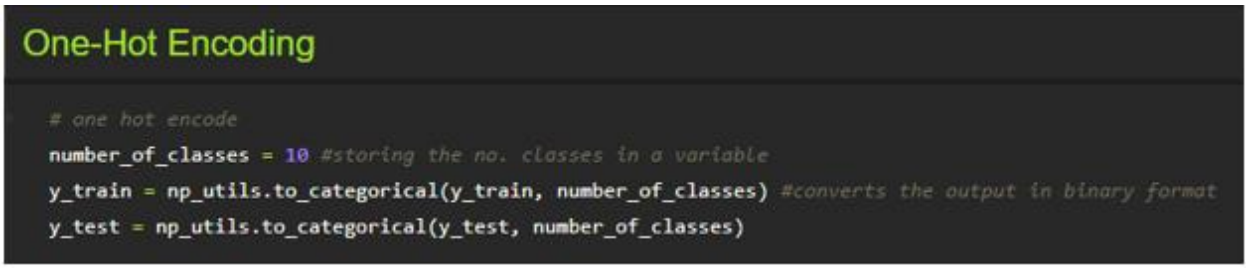
TEAM ID : PNT2022TMID28890

PROJECT NAME : A Novel Method for Handwritten Digit Recognition System

TEAM LEADER : Karthikeyan.V

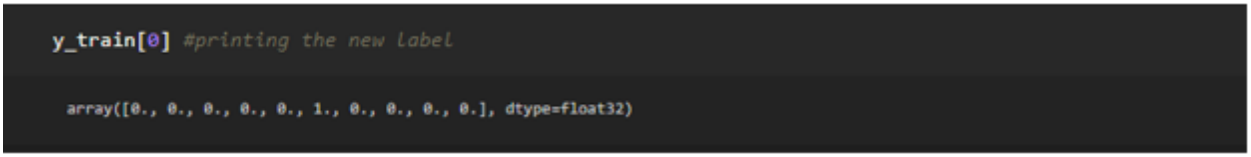
TEAM MEMBER : Karthikeyan.J,Periyasamy.A,Sabarimanikandan.M

If you see our y_train variable contains Labels representing the images containing in x_train. AS these are numbers usually they can be considered as numerical or continuous data, but with respect to this project these Numbers are representing a set of class so these are to be represented as categorical data, and we need to binaries these categorical data that's why we are applying One Hot encoding for y_train set



One hot encoding is a process by which categorical variables are converted into a form that could be provided to ML algorithms to do a better job in prediction. We apply One-Hot Encoding in order to convert the values into 0's and 1's. For a detailed point of view, look at this link

Now let's see how our label 5 is index 0 of y_train is converted



As we see the new the label is printed in the form of 0's and 1's and is of type float.
